sTern

The frontend part of our Software Engineering homework.(?)

Completely a rookie to Android, mainly using the ViewPager template to modify. Complete some basic problems such as register and login, left-right switching, and jumps. By the way, the refresh function is poorly implemented.

It looks like this:

Splash Page

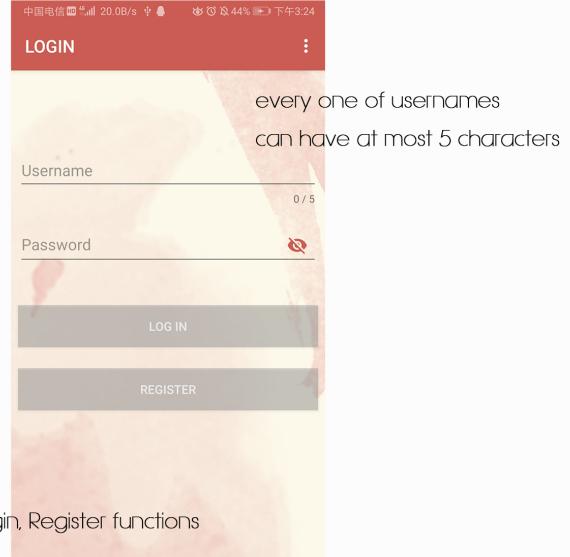

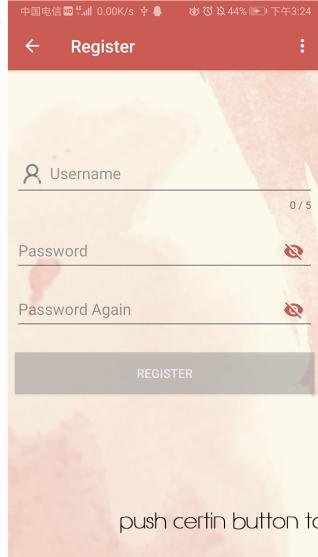

simple Splash Page
with app name & version

Register & Login Page

user can jump from Login Page

to Register Page and can go

back at any time

push certain button to finish Login, Register functions

Main Page

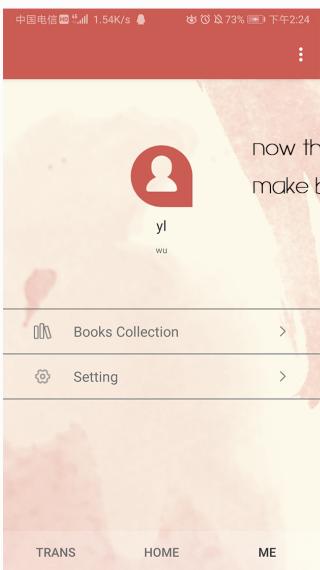

Main Page includes three fragments: Translate Fragment, Home Fragment and User Fragment.

Translate Page promise user to realize translate function by texts or pictures from camera or albums. User can copy the translation result and may uses it in the Search Page

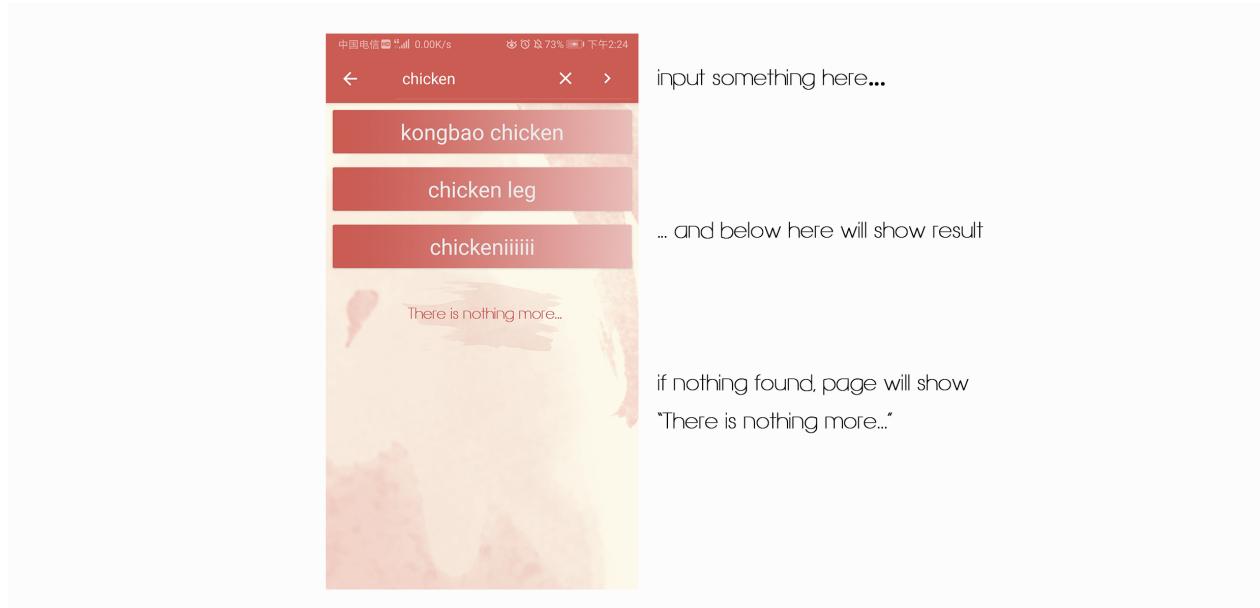

in Home Page, temporary where is only a jump button to the Search Page, will be added more functions in the future versions

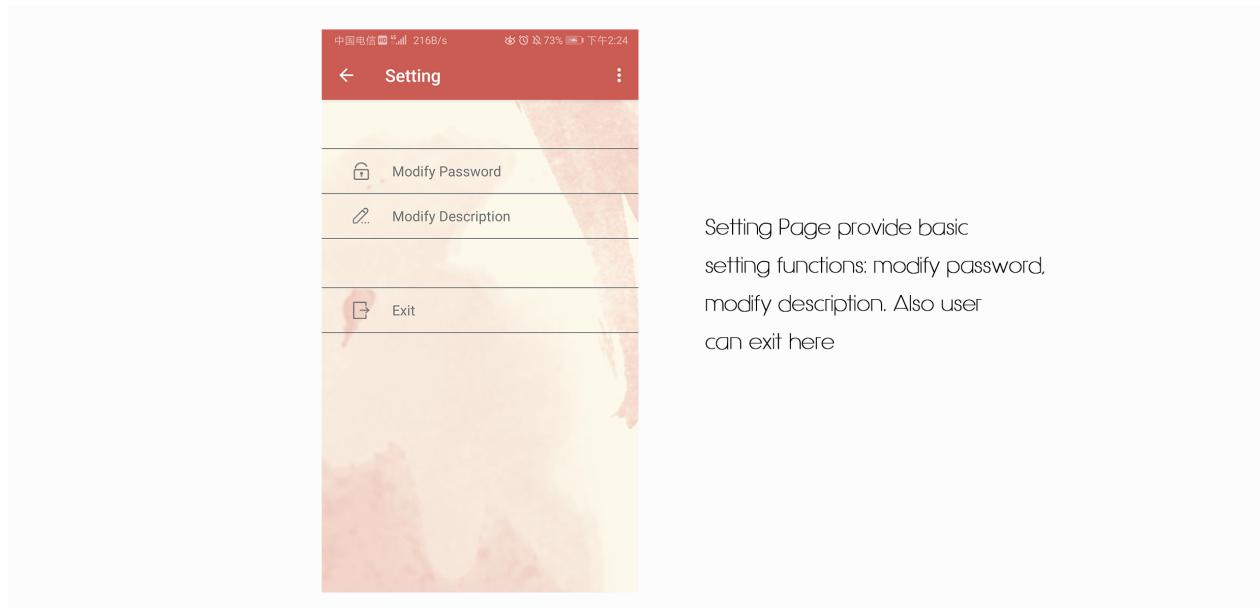

User Page will show users' usernames and descriptions, users can jump to their Book Collection Page and see / manage their books, as well as set their own info.

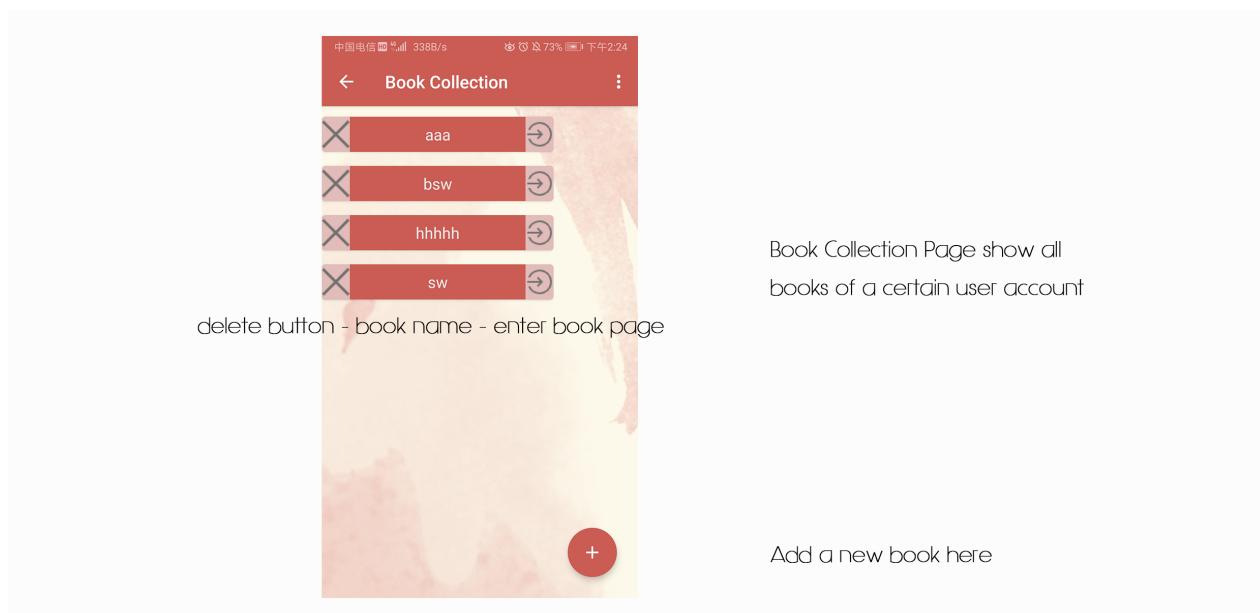

Search Page

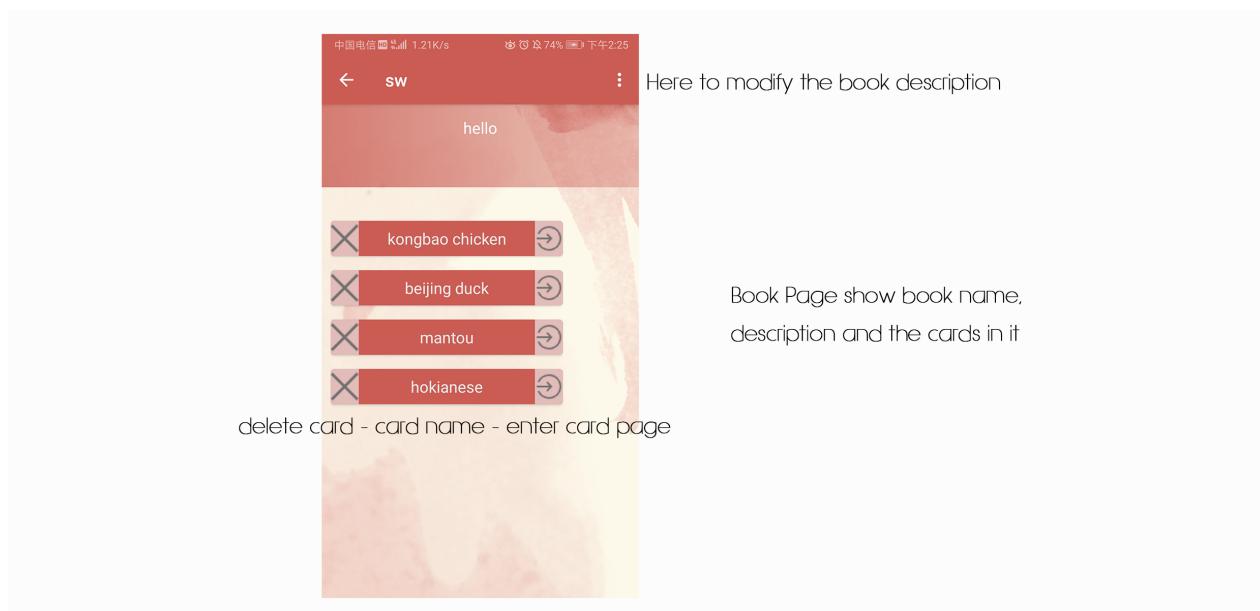

User Info Setting Page

Book(Bag) Collection Page

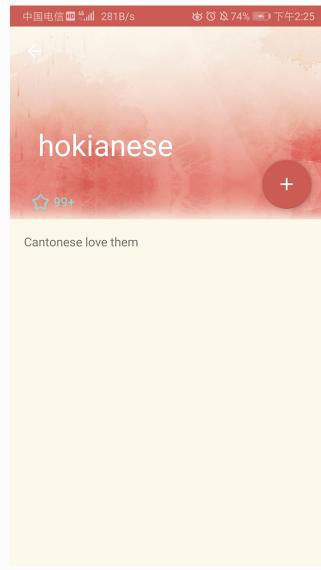

Book(Bag) Page

Card Page

Once be added, the star
number add 1 with 99+ at most

Card Page provide card name
and its description. Also provide
add button to add it to a certain
book of user

Hope this may help.(probably not I think :)
